DETAILED ACTION

Claim Objections

Claims 1-20 are objected to because of the following informalities and/or defects:

Claims 1, 5, 10 and 15 each recite the terms of "lateral size", but fail to clarify which direction is the direction of the recited lateral size, as a 2-D has at least two different directions along its edges.

In claim 10, line 7, the term of "each includes" should read as: --includes--.

Claims 15 and 18 each need to further clarify the direction of each of the fuse regions, as it is not fully clear which sides of the fuse regions are in parallel and which sides are along the recited same direction.

Claims 19 and 20 need to further clarify the relationship(s) between the first and second fuses and the fuse regions already recited in claim 18.

Appropriate correction is required.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claims 1, 5, 10 and 15 each recite the terms of "a lateral size of the fuse bank is directly proportional to a pitch between the connecting

Art Unit: 2811

lines of the first and second fuse regions", but these claims are direct to a final product, wherein there should be only one lateral size (along any direction) and one pitch between the connecting lines (see Fig. 3, 4, 6 and 7), while the recited subject matter may imply that there may be a variety of lateral sizes which vary directly proportionally with a variety of the corresponding pitches of the connecting lines in the same final product. Accordingly, it is not definitely clear about how many different lateral sizes and pitches exist in the claimed device structure, and in what sense the recited lateral size and pitch are directly proportional to each other. If there only have one lateral size and one pitch in the claimed final product, the size relationship between them should be defined by ratio of the two, instead of the recited term of "directly proportional".

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 2, 5, 6 and 9, insofar as being in compliance with 35 U.S.C. 112 and as being best understood in view of the claim objections above, are rejected under 35 U.S.C. 102(b) as being anticipated by Yoon (KR 2001-0029286 (Application No. 99-42035), June 2001; of record).

Yoon discloses a fuse bank (Figs. 2-4; also see US 6,448,626 for its English translation), comprising: first and second fuses (313 and 314), each having a fuse

Art Unit: 2811

region (the corresponding section inside 323) in a first direction, a first connecting line region (including a corresponding upper edge portion in 323 and the corresponding portion in 321) bent along a second direction, and a second connecting line region (including a corresponding lower edge portion in 323 and the corresponding portion in 322) bent along a third direction.

In addition, it is noted that the recited term of "directly proportional" may be interpreted as having some potentially implicated process limitations regarding whether other fuse banks with different lateral sizes and pitches between the connecting lines are also made along with the above discussed fuse bank, and whether the lateral sizes directly proportionally vary from fuse bank to fuse bank with the pitches of the above discussed fuse bank and the also-made fuse banks (assuming that there are only one lateral size and one pitch in each of the fuse banks). However, any of these potentially implicated process limitations would not carry patentable weight in this claim drawing to a structure, because distinct structure is not necessarily produced. In re Thorpe, 227 USPQ 964, 966 (Fed. Cir. 1985).

Regarding claims 5, 6 and 9, it is noted that the first pair of fuses (311 and 312) and second pair of fuses (313 and 314) can be regarded as the first and second fuse groups, respectively; and/or, that the device of Yoon is for a fuse-based defect-correctable DRAM, which normally naturally includes a large amount of repeating basic fuse structures like the one shown in Figs. 2 and/or 3.

Art Unit: 2811

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 3, 4, 7, 8 and 10-20, insofar as being in compliance with 35 U.S.C. 112 and as being best understood in view of the claim objections above, are rejected under 35 U.S.C. 103(a) as being unpatentable over Yoon in view of AAPA (Applicant's Admitted Prior Art) and/or Sakuta (Sakuta et al., US 5,208,782).

The disclosure of Yoon is discussed as applied to claims 1, 2, 5, 6 and 9 above.

Although Yoon does not expressly disclose that the connecting lines can be bent so as to have a right angle to the fuse region's direction, and/or that neighboring fuse banks/groups can be symmetrical about the direction perpendicular to the fuse region's direction, one of ordinary skill in the art would readily recognize that any or all of the connecting lines can be formed perpendicular to the fuse region's direction for obtained a desirable interconnection/orientation layout and/or for reducing layout space, as evidenced in AAPA (see Fig. 2); and/or that such type of perpendicular-direction symmetrical layout is one of the most commonly used circuit layouts in the art for forming the commonly desirably mirror-image-type symmetrical circuit layout and/or for reducing circuit space, as evidenced in Sakuta (see the symmetric circuit layouts in Figs. 4-7).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the right-angle connecting lines of AAPA and/or the perpendicular-direction symmetrical circuit layout of Sakuta, so that a memory device with desired layout, and/or with reduced space, for the connecting lines and/or for the memory circuits therein.

Response to Arguments

Applicant's arguments filed on February 28, 2006, have been fully considered but they are not persuasive. Responses to these arguments have been fully incorporated into the claim rejections and/or objections set forth above in this office action.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shouxiang Hu whose telephone number is 571-272-1654. The examiner can normally be reached on Monday through Thursday, 7:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Eddie C. Lee can be reached on 571-272-1732. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
